Lecture Topic

Elliptic Curve Cryptography

PKC Algorithms: Three Families

e.g.

- RSA algorithm.

e.g.:

- Diffie–Hellman key exchange.
- ElGamal encryption.
- Digital Signature Algorithm (DSA).

e.g.:

- EC Diffie–Hellman key exchange (ECDH).
- EC Digital Signature Algorithm (ECDSA).

Elliptic Curve Cryptography

Problem:

Asymmetric schemes like RSA and Elgamal require exponentiations in integer rings and fields with parameters of more than 1000 bits.

- High computational effort on CPUs with 32-bit or 64-bit arithmetic
- Large parameter sizes critical for storage on small and embedded

Motivation:

Smaller field sizes providing equivalent security are desirable

Solution:

Elliptic Curve Cryptography uses a group of points (instead of integers) for cryptographic schemes with coefficient sizes of 160-256 bits, reducing significantly the computational effort.

ECC is based on the generalized discrete logarithm problem.

What is Elliptic Curve Cryptography ?

- What is Elliptic Curve Cryptography (ECC)?

ECC: cryptography technique based on elliptic curve theory that can be used as faster, smaller, and more efficient cryptosystem.

- Who introduced it and when?

Victor Miller and Neal Koblitz independently, around 1985

- What is the basic principle?

Obtain same level of security as conventional cryptosystems but with much smaller key size

Why use Elliptic Curve Cryptography ?

- How do we analyze Cryptosystems?
 - ❑ How difficult is the underlying problem that it is based upon?
 - RSA – Integer Factorization
 - ElGamal - DSA – Discrete Logarithms
 - ECC - Elliptic Curve Discrete Logarithm problem
- How do we measure difficulty?
 - We examine the algorithms used to solve these problems

Benefits of Elliptic Curve Cryptography ?

- How do we analyze Cryptosystems?
 - Same benefits of the other cryptosystems: confidentiality, integrity, authentication and non-repudiation but...
 - Shorter key lengths
 - ✓ Encryption, Decryption and Signature Verification speed up
 - ✓ Storage and bandwidth savings

Applications of Elliptic Curve Cryptography ?

Many devices are small and have limited storage and computational power

- Where can we apply ECC?
 - Wireless communication devices
 - Smart cards
 - Web servers that need to handle many encryption sessions
 - Any application where security is needed but lacks the power, storage and computational power that is necessary for our current cryptosystems

Elliptic Curve Cryptography

polynomial equations over the real numbers.

Plot of all points (x,y) which fulfill the equation $x^2 + y^2 = r^2$ over \mathbb{R}

Plot of all points (x,y) which fulfill the equation $a \cdot x^2 + b \cdot y^2 = c$ over \mathbb{R}

Elliptic Curve Cryptography

- From the two examples above, we conclude that we can form certain types of curves from polynomial equations.
- An *elliptic curve* is a special type of polynomial equation.
- In cryptography, we are interested in elliptic curves module a prime p :

Definition 9.1.1 Elliptic Curve

The elliptic curve over \mathbb{Z}_p , $p > 3$, is the set of all pairs $(x, y) \in \mathbb{Z}_p$ which fulfill

$$y^2 \equiv x^3 + a \cdot x + b \pmod{p}$$

together with an imaginary point of infinity \mathcal{O} , where

$$a, b \in \mathbb{Z}_p$$

and the condition $4 \cdot a^3 + 27 \cdot b^2 \not\equiv 0 \pmod{p}$.

□ Note that $\mathbb{Z}_p = \{0, 1, \dots, p-1\}$ is a set of integers with modulo p arithmetic

Elliptic Curve Cryptography

- Elliptic curves are polynomials that define points based on the (simplified) Weierstrass equation:

$$y^2 = x^3 + ax + b$$

for parameters a, b that specify the exact shape of the curve

- On the real numbers and with parameters $a, b \in \mathbb{R}$, an elliptic curve looks like this à □
- Elliptic curves can not just be defined over the real numbers \mathbb{R} but over many other types of finite fields.

Elliptic Curve Cryptography

$$P = (x_1, y_1) \text{ and } Q = (x_2, y_2)$$

$$P + Q = R$$

$$(x_1, y_1) + (x_2, y_2) = (x_3, y_3)$$

Point Addition $P+Q$ This is the case where we compute $R = P + Q$ and $P \neq Q$.

The construction works as follows: Draw a line through P and Q and obtain a third point of intersection between the elliptic curve and the line.

Point Doubling $P+P$ This is the case where we compute $P+Q$ but $P = Q$. Hence, we can write $R = P+P = 2P$.

Point addition on an elliptic curve over the real numbers

Point doubling on an elliptic curve over the real numbers

Elliptic Curve Cryptography

Elliptic Curve Point Addition and Point Doubling

$$x_3 = s^2 - x_1 - x_2 \pmod{p}$$

$$y_3 = s(x_1 - x_3) - y_1 \pmod{p}$$

where

$$s = \begin{cases} \frac{y_2 - y_1}{x_2 - x_1} \pmod{p} & \text{if } P \neq Q \text{ (point addition)} \\ \frac{3x_1^2 + a}{2y_1} \pmod{p} & \text{if } P = Q \text{ (point doubling)} \end{cases}$$

Elliptic Curve Cryptography

Example :

Consider the Elliptic curves Weierstrass equation is : $y^2 = x^3 + 3x + 10 \pmod{29}$

let $P=(5,11)$, $Q=(10, 24)$,

1. Add the points P, Q.
2. Double the point P.

$$y^2 = x^3 + ax + b$$

Answer:

From Elliptic equation, we have $a= 3$, $b=10$, $P=29$

1. For Adding points P, Q , we should calculate S to be able calculate R

$$S = \frac{y_2 - y_1}{x_2 - x_1} \pmod{p}$$

$$P + Q = R$$

$$(x_1, y_1) + (x_2, y_2) = (x_3, y_3)$$

$$S = \frac{24 - 11}{10 - 5} \pmod{29} = 13 * (5)^{-1} \pmod{29} = 13 * 6 \pmod{29} = 20$$

$$x_3 = s^2 - x_1 - x_2 \pmod{p}$$

$$x_3 = 8 , y_3 = 16$$

$$y_3 = s(x_1 - x_3) - y_1 \pmod{p}$$

$$R=(8,16)$$

Elliptic Curve Cryptography

Example :

Consider the Elliptic curves Weierstrass equation is : $y^2 = x^3 + 3x + 10 \pmod{29}$

let $P=(5,11)$, $Q=(10, 24)$,

1. Add the points P, Q.
2. Double the point P.

Answer:

2. For Doubling point P, we should calculate S to be able calculate R

$$R = P+P = 2P.$$

$$S = \frac{3x_1^2 + a}{2y_1} \pmod{p}$$

$$S = \frac{3(5)^2 + 3}{2 * 11} \pmod{29} = \frac{78}{22} \pmod{29} = \frac{78 \pmod{29}}{22 \pmod{29}} \pmod{29} = 20 * 22^{-1} \pmod{29} = 20 * 4 \pmod{29} \\ = 80 \pmod{29} = 22$$

$$x_3 = s^2 - x_1 - x_2 \pmod{p}$$

$$y_3 = s(x_1 - x_3) - y_1 \pmod{p}$$

$$x_3 = 10 , y_3 = 24 \\ R=(10, 24)$$

Elliptic Curves Diffie–Hellman Key Exchange

ECDH Domain Parameters

1. Choose a prime p and the elliptic curve

$$E : y^2 \equiv x^3 + a \cdot x + b \pmod{p}$$

2. Choose a primitive element $P = (x_P, y_P)$

The prime p , the curve given by its coefficients a, b , and the primitive element P are the domain parameters.

Elliptic Curve Diffie–Hellman Key Exchange (ECDH)

Alice

choose $k_{prA} = a \in \{2, 3, \dots, \#E - 1\}$
compute $k_{pubA} = aP = A = (x_A, y_A)$

Bob

choose $k_{prB} = b \in \{2, 3, \dots, \#E - 1\}$
compute $k_{pubB} = bP = B = (x_B, y_B)$

compute $aB = T_{AB}$

Joint secret between Alice and Bob: $T_{AB} = (x_{AB}, y_{AB})$.

compute $bA = T_{AB}$

Elliptic Curves Diffie–Hellman Key Exchange

The correctness of the protocol is easy to prove.

Proof. Alice computes

$$aB = a(bP)$$

while Bob computes

$$bA = b(aP).$$

Elliptic Curve Digital Signature Algorithm (ECDSA)

Key Generation for ECDSA

1. Use an elliptic curve E with
 - modulus p
 - coefficients a and b
 - a point A which generates a cyclic group of prime order q
2. Choose a random integer d with $0 < d < q$.
3. Compute $B = dA$.

The keys are now:

$$k_{pub} = (p, a, b, q, A, B)$$

$$k_{pr} = (d)$$

Elliptic Curve Digital Signature Algorithm (ECDSA)

ECDSA Signature Generation

1. Choose an integer as random ephemeral key k_E with $0 < k_E < q$.
2. Compute $R = k_E A$.
3. Let $r = x_R$.
4. Compute $s \equiv (h(x) + d \cdot r) k_E^{-1} \pmod{q}$.

ECDSA Signature Verification

1. Compute auxiliary value $w \equiv s^{-1} \pmod{q}$.
2. Compute auxiliary value $u_1 \equiv w \cdot h(x) \pmod{q}$.
3. Compute auxiliary value $u_2 \equiv w \cdot r \pmod{q}$.
4. Compute $P = u_1 A + u_2 B$.
5. The verification $ver_{k_{pub}}(x, (r, s))$ follows from:

$$x_P \begin{cases} \equiv r \pmod{q} \implies \text{valid signature} \\ \not\equiv r \pmod{q} \implies \text{invalid signature} \end{cases}$$
